EXECUTIVE BRIEFING

Economics of AI: What 81,000 Users Said

Direct evidence linking AI exposure, productivity, and job-displacement fear

81,000 users	5.1 / 7	1 in 5	Open-ended survey + LLM classifiers
Sample size	Mean productivity gain	Voice job-loss fear	Method

Anthropic · Massenkoff & Huang · 2026 · 81K Claude users survey

CONTEXT

Why This Survey Matters

First large-scale qualitative bridge from observed AI usage to what users actually feel.

PRIOR ANTHROPIC WORK

- Economic Index: what tasks Claude performs
- Observed exposure: % of a job's tasks Claude touches
- Tells us what — but not how users feel about it
- No direct link between usage and sentiment

WHAT THIS ADDS

- 81,000 self-selected Claude users
- Open-ended interview inside Claude.ai
- Claude-powered classifiers extract sentiment, job, career stage
- Connects observed-exposure data to perceived job threat

81,000
Users surveyed

1–7
Productivity rating scale

Open-ended

AGENDA

What This Deck Covers

01 Key Findings & Trends
Three headline patterns from the survey

02 Core Views
Sentiment tracks exposure; experience matters

03 Themes
Who fears AI · who benefits from AI

04 Strategic Insights
The U-shaped speedup-anxiety paradox

05 Recommended Actions
Five moves for enterprise leaders

06 References
Source paper, methodology, citation map

WHAT THE DATA SHOWS

01 Key Findings & Trends

- Exposure correlates with fear
- High AND low wage gain most
- Speedup feels good — and threatening

FINDINGS

The Headline Numbers

Productivity gains are real and large — but anxiety scales with exposure.

5.1 / 7

Mean productivity rating

Self-reported on 1–7 scale; 5 ≈ 'substantially more productive'

§Who benefits from AI?

1 in 5

Voice concern about job displacement

20% of respondents directly expressed worry about losing their role

§Who worries about job displacement?

3×

Top-25% exposure vs bottom-25% mentioning job threat

+1.3 percentage points in perceived threat per 10pt increase in exposure

Figure 1

48% · 40%

Cite scope gains · speed gains

Scope = 'I'm a non-tech guy but now I'm a full-stack developer'

§Scope and speed

Two stories sit on top of each other: AI is making people meaningfully more productive — and the same people, especially those most exposed, are increasingly nervous about what comes next.

WHAT THE AUTHORS ARE ARGUING

02 Core Views

- Sentiment tracks exposure
- Career stage shapes everything
- Benefits ≠ feeling safe

DIRECT FROM THE PAPER

Thesis: People's Intuitions Match the Usage Data

> “People's intuitions track the usage data: they worry most about AI's effect in the jobs where we observe Claude doing the most work.
>
> **— §Discussion**

Well like anyone who has a white collar job these days I'm 100% concerned, pretty much 24/7 concerned about losing my job eventually to A.I.

— Software engineer respondent

WHY THIS MATTERS

Workers are not naïve. They can feel the diffusion of AI in their own occupations long before formal labor statistics show displacement. The fear is rational — and concentrated where Claude is most active.

Three Patterns Behind the Headline Numbers

Productivity, threat perception, and benefit flow each follow distinct distributions.

① Exposure → Threat Perception

The more AI does in your occupation, the more you fear displacement. Linear, measurable, and tracks observed exposure.

EVIDENCE

Every 10pt increase in observed exposure = +1.3pt in perceived job threat. Top quartile mentions worry 3× as often as bottom quartile.

Figure 1

② Wage Distribution Is Bimodal

Highest- and lowest-wage occupations report the largest productivity gains. Middle-wage groups gain the least.

EVIDENCE

Software developers report top gains — but so do customer service reps and delivery drivers building side businesses.

Figure 3

③ Career Stage Splits Beneficiaries

Early-career workers are simultaneously more anxious and less confident they personally benefit.

EVIDENCE

Only 60% of early-career say they personally benefit, vs 80% of senior professionals.

Figure 2 & 4

HOW AI RESTRUCTURES WHO WINS

03 Themes

- Scope > speed for users
- Speedup ↔ anxiety U-shape
- Beneficiary ≠ provider

THEME

Theme A — Scope and Speed, Not Just Speed

Most users describe AI unlocking new abilities, not just faster execution.

SCOPE (48%)

- "I'm a non-tech guy but now I'm a full-stack developer"
- Customer service rep starts e-commerce business
- Landscaper builds music application
- AI lets users attempt tasks they couldn't before

SPEED (40%)

- "15 minutes that used to take 2 hours" — accountant
- Faster code reviews, contract checks, paperwork
- Quality gains via more thorough verification
- Cost gains: replace work that exceeded budget

WHY THIS MATTERS

AI is not just an efficiency tool — for many users, it is an access tool. The distinction shapes who gains and how.

Source: §Scope and speed

THEME

Theme B — Speedup and Anxiety Form a U-Shape

Both extremes — being slowed down and being sped up the most — correlate with the highest job threat.

SLOWED-DOWN USERS (LEFT TAIL)

- Creative workers find AI stifling, rigid
- Fear AI diffusion into their field anyway
- Examples: fine artists, certain writers
- Highest threat perception in the U

SPED-UP USERS (RIGHT TAIL)

- Largest measured productivity gains
- Highest threat perception above baseline
- Logic: if my tasks shrink rapidly, what's left?
- Speed gain ≠ job security

STRATEGIC IMPLICATION

The narrative "AI just makes good workers more productive" misses half the story. The most-empowered users are also the most worried.

Source: Figure 6 — U-shaped relationship between speedup level and perceived job threat

HIDDEN STRUCTURAL RISKS

04 Strategic Insights

- Self-selection bias
- Beneficiary capture
- Early-career squeeze

Strategic Insight: Two Long-Term Risks

Today's positive sentiment hides structural questions about who actually captures the gains.

RISK 1 Beneficiary Capture by

Most workers say benefits flow to themselves — but a meaningful share report employers extracting the gains.

SIGNAL IN THE DATA

10% of respondents who named a beneficiary said their employer or clients were the ones getting more work from them.

→ Productivity gain ≠ wage gain. Without bargaining power, the surplus accrues to firms, not workers.

RISK 2 Early-Career Squeeze

The cohort with the most anxiety is also the cohort least confident they personally benefit — a structural mismatch.

AUTHORS' FRAMING

Only 60% of early-career workers see themselves benefiting (vs 80% of senior). Hiring of recent grads is already slowing in the U.S.

→ The traditional 'climb the ladder' career path may be eroding from the bottom rungs first.

WHAT ENTERPRISE LEADERS SHOULD DO NOW

05 Recommended Actions

- Build trust, not just productivity
- Re-design onboarding
- Share the upside

RECOMMENDED ACTIONS

Five Moves for Enterprise Leaders

Workers' fear of AI is rational and predictable — and you can act on it.

#	ACTION	WHAT TO DO	EXPECTED OUTCOME
1	**Measure Exposure Internally**	Build your own observed-exposure map: % of each role's tasks done by AI today.	*Identify which teams will feel threatened first; prioritize change management there.*
2	**Focus on Scope, Not Just Speed**	Position AI as an access tool — enabling new tasks — rather than a labor-cost cutter.	*Aligns with the 48% who already frame AI as scope-expansion; reduces displacement framing.*
3	**Re-design Junior Pathways**	Create AI-augmented apprenticeship programs that explicitly protect early-career talent development.	*Counters the early-career squeeze; preserves the future senior pipeline.*
4	**Share Productivity Upside**	Explicit gain-sharing schemes — bonuses, equity, or time-off — tied to measurable AI-driven productivity wins.	*Closes the 'employer captures the gain' gap; converts anxiety into engagement.*
5	**Talk to the Anxious Top Performers**	Don't assume highest-speedup workers feel safest. Run sentiment listening explicitly with them.	*Heads off attrition in your highest-leverage staff; turns U-shape insight into retention.*

SYNTHESIS

The Big Picture

AI is empowering and unsettling its users at the same time — and the two feelings live in the same people.

01

What changed

The first large-scale qualitative data linking observed AI usage to user sentiment. Productivity gains are real, broad-based, and skewed bimodally across the wage distribution.

02

What it means

Worker anxiety is not paranoia — it tracks measurable exposure. The most-empowered users are simultaneously the most worried. Career stage shapes who benefits.

03

What to watch

Beneficiary capture (who keeps the surplus) and the early-career squeeze (who gets in) are the two structural risks behind the positive top-line numbers.

> *The opportunity is not just to deploy AI — it is to do so in a way that lets the workforce share both the upside and the certainty.*
